

Q1 $(p \rightarrow q) \wedge q \rightarrow p$

ans. c) contingency.

Q2 ans. a) $(p \leftrightarrow q) \leftrightarrow (p \rightarrow q) \wedge (q \rightarrow p)$.

Q3 ans. a) Mathematical induction.

Q4 $a_n = (2.4) 3^n + 0.6 (-2^n)$.

Q5 Direct proof is a sequence of statements which one either gives or deductions from previous statements, & whose last statement is the conclusion to be proved.

if $x > y$, $\max(x, y) = x$, $\min(x, y) = y$

$\therefore \max(x, y) + \min(x, y) = x + y$

if $x < y$, $\max(x, y) = y$, $\min(x, y) = x$

$\therefore \max(x, y) + \min(x, y) = y + x$.

Q6 if P is a set of integers such that
i) a is in P , ii) if all integers k , $a \leq k \leq n$ are in P ,
then $n+1$ is also in P .

then $P = \{x \in \mathbb{Z} \mid x \geq a\}$ that is, P is the set of all integers greater than or equal to a .

Let $M(n) \Rightarrow$ "You can run n^{th} mile",

Base Step : $n=1, n=2$,

$M(1)$ and $M(2)$ are true, according to question.

Inductive :

Assume $M(1), M(2) \dots M(k)$ are all true,
then you can run first k miles.

Since, $M(k-1)$ is true, then $M(k+1)$ is true,
as you can run 2 miles more after a specific mile.

Conclusion :

By the principle of strong induction,
 $M(n)$ is true for all positive n integers.

Q.7. Proof with example.

$$a_n = 6a_{n-1} - 9a_{n-2}, \quad a_0 = 1, a_1 = 6.$$

$\therefore x^2 - 6x + 9 = 0$ has only 3 as root.

Solution format: $\alpha_1 3^n + \alpha_2 n 3^n$,

$$a_0 = 1 = \alpha_1, \quad a_1 = 6 = \alpha_1 3 + \alpha_2 3$$

$$\Rightarrow \boxed{\alpha_1 = 1, \alpha_2 = 1}$$

$$\therefore \underline{a_n = 3^n + n 3^n}$$
